## LZR ${ }^{\oplus}$-U910 <br> Protocol

## 1. Introduction

This application note contains useful information for communication with the $L Z R^{\circledR}-\mathrm{U} 910$ raw data laser scanner from BEA.

## 2. Overview of all functions

### 2.1 Reminder: The laser scanner platform LZR

The following picture (Figure 1) shows how the laser scanner (LZR) is generally installed when used vertically. However, it can also be used horizontally.

Figure 1

The LZR's main characteristics are:

Technology
Number of planes
Tilt angle shift between planes
Number of measurement points per plane
Optical angular opening area
Angular resolution
Speed of motor rotation
Scanning frequency
Measurement area

TOF (Time of Flight)
4
approximately $2^{\circ}$
274
$96^{\circ}$
$96^{\circ} / 273=0,3516^{\circ}$
900 rpm
15 Hz
max. 65 m

The following picture (Figure 2) shows the correlation between the spots and the angular scanning position.

Figure 2
Distance measurement of spot $0 \quad-48^{\circ}$
Distance measurement of spot 273
$+48^{\circ}$

## Characteristics of the laser spot:

Spot size depending on scanning distance:

| Distance | Height | Length |
| :--- | :--- | :--- |
| $m$ | $m m$ | $m m$ |
| 1 | 16 | 6,4 |
| 2 | 32 | 12,8 |
| 3 | 48 | 19,2 |
| 4 | 64 | 25,6 |
| 5 | 80 | 32 |

Basic relation spot length vs spot height: $1 \times 2,5$ (length $\times$ height)

Characteristics of the distance measurement:
The maximum measurement distance range of the LZR-U910 is 65 m . Therefore, all objects at 65 m or at any distance higher than 65 m will lead to a measurement distance value of 65 m .
The detection of a target with min. 2\% remission factor is ensured until 10 m (in clear conditions).

### 2.2 Communication protocol

## 2.2 a) Serial communication

The main characteristics of the serial communication are:

Type
Electrical interface
Communication mode
Data transmission speed
Topology
Encoding
Data word length
Bytes order

Asynchronous
RS-485
Simplex
460.8 kbps

Point to point
1 start bit, 1 stop bit, no parity bit
8 bits
little-endian, LSB (Least Significant Byte) first

## 2.2 b) Structure of the data stream

A complete transmitted data stream is composed mainly of three different kinds of information: "header", "message" and "footer".

The following figure shows the structure of the complete data stream:

|  | Header |  | Message |  |  |  |  |  | Footer |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Code | SYNC <br> OxFFFE FDFC | SIZE 2208 | $\begin{aligned} & \text { CMD } \\ & 50011 \end{aligned}$ | Id + Frame counter counter | Data <br> Plane <br> $\mathrm{n}^{\circ} 2$ <br> (20) | Data <br> Plane $\mathrm{n}^{\circ} 4$ ( $6^{\circ}$ ) | Data <br> Plane <br> $\mathrm{n}^{\circ} 1$ <br> $\left(0^{\circ}\right)$ | Data <br> Plane <br> $n^{\circ} 3$ <br> (4ㅇ) | CHK |
| Length (byte) | 4 | 2 | 2 | 6 | 548 | 548 | 548 | 548 | 2 |

The length of a data stream is 2208 bytes.
4 Synchronization bytes
2 Size bytes
2 Command bytes
4 CAN number (Id) bytes
2 Frame Counter bytes
2192 Data bytes:

- 2 bytes per distance measurement
- 4 planes
- 274 distance measurements per plane

2 Checksum bytes

Please refer to the first picture concerning the plane numbers

## 2.2 c) Basic symbols

The communication symbols used in a transmitted data stream are:

## "Header"

## SYNC

This symbol is used to allow the synchronization between the laser scanner and the host.

| Size | 4 bytes |
| :--- | :--- |
| Value | $0 \times F F F E$ FDFC |
| Structure | LSB first, MSB last |

## SIZE

This symbol is used to transmit the length of the block "message".

| Size | 2 bytes |
| :--- | :--- |
| Value | Serial number (decimal value): 2208 |
| Structure | LSB first, MSB last |

## "Message"

## CMD

This symbol is used to transmit the command relative to the "data sending" mode.

| Size | 2 bytes |
| :--- | :--- |
| Value | Serial number (decimal value): 50011 |
| Structure | LSB first, MSB last |

## Identification + Frame Counter

This symbol is used to transmit two information: the unique identification number of the LZR in use (CAN number) and the number of frames transmitted since the last power on.
The latter one is limited to 2 bytes. Therefore, once 65000 frames counted, this value will start from 0 on again.
ID:
Size 4 bytes
Value Identification number (CAN number) of the laser scanner
Structure LSB first, MSB last
Frame Counter:
Size 2 bytes
Value number of complete communication frames sent (max. 65000)
Structure LSB first, MSB last

## Data

This symbol is used to transmit any distance information to the controller.

| Size | 2 bytes |
| :--- | :--- |
| Value | Distance (decimal value) |
| Structure | LSB first, MSB last |

NB: All distance measurements made by the LZR are expressed in mm. Maximum distance: 65000 mm .

## "Footer"

## CHK

This symbol is used to transmit the checksum (CHK), which is the sum of all bytes of the "message" part of the communication frame.

| Size | 2 bytes |
| :--- | :--- |
| Principle | The calculation of the CHK is performed on all bytes of the <br> "message" part of the data stream |
| Structure | LSB first, MSB last |

## 2.2 d) How does it work?

The laser scanner always works in "transmission" mode and sends out the measurement data as soon as he is powered and as soon as the data of a complete scanning cycle is available. The operator should always work in "reception" mode.

### 2.3 Additional functions

Standby mode (Heartbeat mode)

The infrared laser diode that is pulsed in the distance measurement process can be switched ON/OFF by using the external input signal (pin $6 \&$ pin 7; see UG).
The input signal is de-bounced in a way that a pulse signal shorter than 100 ms will not change the state of the laser diode.
In order to activate the heartbeat mode (i.e. to switch off the infrared laser diode) a voltage signal between 10 and 35 V should be applied.
Distance data frames are only sent on serial link when the infrared laser diode is pulsing.
When the infrared laser diode is switched OFF, no data is available, so no data frame is sent. In this standby mode, a "heartbeat" message is sent on the serial link informing the host system monitoring that the LZR is still alive but idle.
The "heartbeat" message follows the same structure as the data frame but with all data values set to 0 .

|  | Header |  | Message |  |  |  |  |  | Footer |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Code | SYNC | SIZE | CMD | Id <br> + <br> Frame <br> Counter | Data <br> Plane <br> $n^{\circ} 2$ <br> $\left(2^{\circ}\right)$ | Data <br> Plane <br> $n^{\circ} 4$ <br> $\left(6^{\circ}\right)$ | Data <br> Plane <br> no <br> $\left(0^{\circ}\right)$ | Data <br> Plane <br> $n^{\circ} 3$ <br> $\left(4^{\circ}\right)$ | CHK |
| Value | OXFFFE <br> FDFC | 2208 | 50011 |  | 0 | 0 | 0 | 0 |  |

The repeat rate of the "heartbeat" transmission is 5 seconds.
